

Balanzify Dashboard

Feature Cards

Documentation

Product	Balanzify Accounting, HR and Payroll
Document Type	Dashboard Feature Cards Specification
Version	Enhanced R&D Edition
Date	June 2026

Unified dashboard concept screen used as the visual base for this documentation.

1. Executive Summary

The improved dashboard is designed as a daily operating command center for owners, finance teams, HR teams, payroll teams, and admins.

Area	Improved direction
Core purpose	Give users a reliable “what needs attention today” view across accounting, sales, banking, payroll, tax, inventory, HR, attendance, support, and approvals.
Design direction	Use KPI-first layout, clear card hierarchy, contextual charts, compact tables, severity badges, and drill-down interactions.
Data direction	Every card must be driven by the same global filters: company, date range, branch/location, role permission, currency, module availability, and data freshness.
User experience direction	Cards should be actionable. A summary without a next action should not be shown on the primary dashboard unless it gives clear business value.

2. R&D Summary and Benchmark Findings

Research was used to improve the structure, hierarchy, accessibility, and decision logic of the Balanzify dashboard.

R&D source	Finding applied to Balanzify	Reference
Nielsen Norman Group	Dashboards should provide at-a-glance information users can act on quickly. Applied by prioritizing KPI, alert, and action cards over decorative metrics.	https://www.nngroup.com/articles/dashboards-preattentive/
Tableau dashboard best practices	Effective dashboards should speed up decision-making, use clear goals, filters, tooltips, and actions. Applied by making every card clickable and filter-aware.	https://help.tableau.com/current/pro/desktop/en-us/dashboards_best_practices.htm
Microsoft Power BI accessibility guidance	Accessible reports should support keyboard navigation, screen readers, high contrast themes, and alternative text. Applied through contrast, labels, alt-text and focusable cards.	https://learn.microsoft.com/en-us/power-bi/create-reports/desktop-accessibility-creating-reports
Intuit QuickBooks dashboard/product patterns	Accounting dashboards emphasize money-in, money-out, invoices, bills, reports, inventory, and cash visibility. Applied by connecting Balanzify cards to AR, AP, banking, inventory, tax, and payroll workflows.	https://quickbooks.intuit.com/

3. Recommended Dashboard Layout Strategy

The layout should help users read the business condition from top to bottom in a natural priority order.

Dashboard zone	Purpose and placement logic
Header and global controls	Company switcher, date range, search, create-new menu, notifications, profile, branch/location filter, and module shortcuts.
KPI summary strip	Highest-level business health: revenue, cash, AR, AP, payroll, tax, inventory, profit, attendance.
Primary analysis zone	Cash Flow Overview and AI Business Insights. This area answers “what is happening?” and “what needs action?”
HR and operations zone	Attendance Summary, Employee Overview, Leave Requests, Today’s Workforce, Upcoming Events.
Finance operations zone	Invoice Overview, Recent Transactions, Bank Balances, Support Tickets, Activity Feed.
Growth and workflow zone	Top Customers, Top Selling Products, Approval Center, Expense/Cash cards.
Compliance and risk zone	Payroll Snapshot, Tax Center, AR Aging, AP Aging, Expense Breakdown, Cash Runway.
Quick Actions zone	Role-based command tiles for the most common workflows.

4. Global Data Representation Logic

These rules must be applied across every dashboard card to keep numbers consistent and trustworthy.

Rule	Implementation logic
Global filter state	All cards read company_id, branch_id/location_id, date_from, date_to, comparison_period, currency, timezone, accounting_basis, and role permission.
Currency display	Use company base currency by default. If multi-currency is active, convert values using transaction exchange rate for posted historical values and current exchange rate only for live estimates.
Comparison percentage	Trend % = (current period value - previous matching period value) / abs(previous matching period value) x 100. If previous value is zero, show “New” or “No previous data” instead of infinite percentage.
Open balance	Open balance = original amount - applied payments - credits - refunds - write-offs. Use open balance for AR/AP, due, and aging cards.
Aging bucket	Aging is calculated as report date minus due date. Buckets: Current, 1-30, 31-60, 61-90, 90+ days. A company may configure bucket labels.
Cash flow basis	Cash flow uses actual bank/cash movements. Non-cash journals should not change cash flow unless they affect a cash/bank account.
Accrual basis reporting	P&L, Income vs Expense, and some KPI cards can use accrual basis depending on selected report basis.
Card freshness	Every card should support last_updated_at, data_source, sync_status, and error_state. Stale bank or payroll data must be visible.
Role based visibility	Cards and actions should respect RBAC, plan features, and sensitive data settings. Payroll, tax, and employee cards need stricter permissions.
Drill-down	Each card passes filter parameters to the target route/report. Dashboard values and detailed list values should reconcile.

5. Data Flow and State Model

A dedicated dashboard aggregator keeps the dashboard fast and consistent while still allowing real-time refresh after important actions.

Layer	Recommended approach
Source modules	Sales, Customers, Expenses, Suppliers, Bank, Chart of Accounts, Inventory, HRIS, Attendance, Leave, Payroll, Tax Center, Support, Audit Log, AI Insights.
Aggregator layer	A dashboard service reads from source modules and prepares card-specific summaries. It can write to a dashboard_snapshot table or cache layer for fast loading.
Refresh triggers	Invoice paid, bill paid, bank sync completed, payroll finalized, tax payment recorded, leave approved, attendance sync completed, inventory adjustment posted, support ticket updated.
Snapshot payload	Each card returns value, comparison_value, trend_direction, chart_series, list_items, action_route, last_updated_at, and permission_state.
Error handling	If one card fails, the full dashboard should not fail. Show that card’s error state and allow retry.

6. Common Card States

Every card should be designed for more than the perfect data case.

State	User-facing behavior
Loading	Show skeleton UI with the final card shape so layout does not jump.
Empty	Show meaningful empty state: “No invoices due for this period” or “No approvals pending.”
Stale	Show last updated time and a refresh option, especially for banking, attendance device sync, payroll and tax data.
Permission restricted	Hide sensitive values or show a permission message based on RBAC policy.
Partial data	Show a warning when one source is unavailable, e.g., bank sync failed but ledger data is still available.
Error	Show a non-blocking error with retry, support link, and source module context.

7. Feature Card Index

The following cards are included in the enhanced Balanzify dashboard specification.

No.	Feature card	Module	No.	Feature card	Module
01	KPI Summary Cards	Business Overview	14	Open Support Tickets	Support
02	Cash Flow Overview	Finance Analytics	15	Activity Feed	Audit Log and Activity
03	Profit & Loss Graph	Finance Analytics	16	Top Customers	Customers and Sales Analytics
04	Income vs Expense	Finance Analytics	17	Top Selling Products	Inventory and Sales
05	AI Business Insights	AI and Alerts	18	Approval Center	Workflow and Approvals
06	Attendance Summary	HR and Attendance	19	Mini Expense and Cash Cards	Expense and Cash Health
07	Employee Overview	HRIS	20	Payroll Snapshot	Payroll
08	Leave Requests	Leave Management	21	Tax Center Snapshot	Taxes and Agencies
09	Today's Workforce	Attendance and Scheduling	22	Accounts Receivable Aging	Receivables
10	Upcoming Events	HR Calendar	23	Accounts Payable Aging	Payables
11	Invoice Overview	Sales and Receivables	24	Expense Breakdown	Expenses
12	Recent Transactions	Transactions and Ledger	25	Cash Runway	Cash Forecasting
13	Bank Balances	Banking	26	Quick Actions	Productivity Shortcuts

8. Feature Wise Card Documentation

Each card below includes a user story, what the user understands, calculation logic, interaction behavior, and data state guidance.

The images are UI references from the current Balanzify dashboard card design set. Final values should be connected to live APIs and not hardcoded.

01. KPI Summary Cards

Module: Business Overview

User story: As a business owner, I want one row of the most important numbers so I can understand the business health before opening detailed reports.

What the user understands: Revenue, cash, receivables, payables, payroll due, tax due, inventory value, profit, and attendance risk in one quick scan.

Data representation logic: Each KPI aggregates posted and eligible records for the selected company, branch, currency, and date range. Trend equals current period compared with the previous matching period. Due items use open balance and due date, not invoice date only.

Expected interaction: Clicking each KPI opens the matching report or list with filters applied. Example: Accounts Receivable opens open invoices; Payroll Due opens the next payroll run; Tax Due opens the tax center.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Use this row as the dashboard decision layer. Do not overload it with every metric; keep only owner-level health indicators.

02. Cash Flow Overview

Module: Finance Analytics

Cash Flow Overview UI reference

User story: As a finance user, I want to compare cash coming in and cash going out so I can plan upcoming payments and avoid cash shortage.

What the user understands: Whether the business is collecting faster than it is spending, and how the trend changes by day, week, month, or quarter.

Data representation logic: Cash inflow includes customer payments, deposits, sales receipts, refunds received, and other bank inflows. Cash outflow includes expenses, supplier payments, payroll, tax payments, refunds paid, and bank fees. Exclude non-cash journal entries unless the user switches to accrual view.

Expected interaction: Tabs switch between Cash Flow, Profit & Loss, and Income vs Expense. Date buttons change grouping. Hover shows inflow and outflow values for a point.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Use cash-basis ledger movements for cash flow; use accrual basis only when the user explicitly selects accrual reporting.

03. Profit & Loss Graph

Module: Finance Analytics

Implementation note: Keep P&L data connected to the Chart of Accounts classification so account mapping stays consistent with reports.

04. Income vs Expense

Module: Finance Analytics

User story: As a finance user, I want a simple income and expense comparison so I can spot overspending months quickly.

What the user understands: Month-by-month income, expense, and whether expense pressure is increasing.

Data representation logic: Income includes posted sales income and other income accounts. Expense includes operating expenses, payroll expense, COGS if configured, and tax/payment expense based on report settings. Bars should follow the selected accounting basis.

Expected interaction: Change period, hover for values, and click a bar to open income or expense transactions for that month.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Use consistent colors and labels across all finance cards so users do not relearn chart meaning.

05. AI Business Insights

Module: AI and Alerts

The image shows a UI reference for 'AI Business Insights'. It features a header with a star icon, the text 'AI Business Insights', a 'Beta' badge, and a 'View all insights' link with an upward arrow. Below the header are five insight cards, each with an icon, a title, a summary, and an action link:

- 5 Overdue Invoices**: Total \$32,240.00 from 3 customers. Action: View Invoices →
- 72 Low Stock Items**: Reorder soon to avoid stockouts. Action: View Inventory →
- Payroll Due Soon**: \$18,560.00 due on May 31, 2025. Action: Run Payroll →
- Tax Filing Due**: VAT return due on Jun 15, 2025. Action: View Tax Center →
- Cash Flow Forecast**: Cash balance may dip below \$40K by Jun 5. Action: View Forecast →

AI Business Insights UI reference

User story: As a busy owner, I want Balanzify to surface urgent issues automatically so I do not need to search through every module.

What the user understands: Overdue invoices, low-stock risk, payroll due, tax filing due, cash-flow risk, attendance alerts, and unusual activity are prioritized.

Data representation logic: A rules engine should generate deterministic alerts from thresholds and due dates. AI can rank and summarize alerts by severity, amount impact, due date proximity, and user role. All AI text should link back to source records.

Expected interaction: Each insight has a clear action such as View Invoices, View Inventory, Run Payroll, View Tax Center, or View Forecast.

Data quality state: If AI service is unavailable, show rule-based alerts only and label the summary as unavailable rather than hiding business-critical warnings.

Implementation note: Never let AI create financial numbers without source records. AI should explain, prioritize, and recommend actions from verified data.

06. Attendance Summary

Module: HR and Attendance

Attendance Summary UI reference

User story: As an HR manager, I want today's attendance summary so I can identify late arrivals, absences, and leave impact early.

What the user understands: Present employees, late check-ins, employees on leave, and the day's attendance rate.

Data representation logic: Present count comes from valid check-in records for scheduled employees. Late count compares check-in time with assigned shift start plus grace period. On leave comes from approved leave overlapping today. Attendance rate equals present scheduled employees divided by total scheduled employees.

Expected interaction: Click View Attendance Report to open the daily attendance list filtered by present, late, leave, or absent status.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Respect shift, holiday list, time zone, and employee work location. Do not count employees who are not scheduled today.

07. Employee Overview

Module: HRIS

User story: As HR or management, I want a workforce snapshot so I can see headcount, hiring movement, and upcoming employment actions.

What the user understands: Total employees, new joiners, open positions, upcoming confirmations, employment status split, department split, and quick HR trends.

Data representation logic: Total employees counts active employee profiles. New joiners use joining date in the selected period. Open positions come from recruitment or approved requisitions. Upcoming confirmations use confirmation date within the next configured window.

Expected interaction: Click totals to open employee list filters, department charts to open department view, and confirmations to open pending HR actions.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Headcount should exclude terminated employees after termination date and should respect company/branch filters.

08. Leave Requests

Module: Leave Management

User story: As a manager, I want to see pending leave requests so I can approve or reject them before they affect workforce planning.

What the user understands: How many leave requests are pending, approved, rejected, and which requests need quick attention.

Data representation logic: Pending count uses leave applications with status Pending and dates in current/future windows. Approved and rejected counts come from workflow status. Leave duration is calculated using leave type rules, holidays, weekends, and hourly/full-day configuration.

Expected interaction: Click a request to review details, supporting documents, balance impact, and approval actions. View all opens Leave Center filtered to pending.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Do not deduct final leave balance until approval unless company policy reserves pending days separately.

09. Today's Workforce

Module: Attendance and Scheduling

Implementation note: This card should update in near real time after attendance device sync or manual check-in correction.

12. Recent Transactions

Module: Transactions and Ledger

Recent Transactions				
Your latest financial activities				
DATE	DESCRIPTION	TYPE	STATUS	AMOUNT
 May 24, 2025 10:45 AM	Invoice #INV-2025-042 Acme Corporation	 Income	Paid	+\$7,850.00 USD
 May 24, 2025 09:30 AM	Office Supplies Staples	 Expense	Pending	-\$125.50 USD
 May 23, 2025 04:15 PM	Bank Transfer City Bank PLC	 Transfer	Completed	+\$5,000.00 USD
 May 23, 2025 02:20 PM	Payment Received John Doe	 Income	Completed	+\$1,250.00 USD
 May 23, 2025 11:05 AM	Software Subscription Xero Accounting	 Expense	Paid	-\$49.99 USD
 May 22, 2025 03:40 PM	Invoice #INV-2025-041 Beta Solutions Ltd.	 Income	Sent	+\$3,200.00 USD
 Total Income \$17,300.00		 Total Expenses \$175.49		

Recent Transactions UI reference

User story: As a business user, I want to see the latest financial movement so I can verify recent activity without opening the full ledger.

What the user understands: Recent invoice payments, expenses, bank transfers, supplier payments, and customer payments with amount direction.

Data representation logic: Pull the latest posted or synced transactions from the ledger, bank feed, sales, expense, and payroll modules. Show amount sign based on cash impact. Sort by transaction date and then created time.

Expected interaction: Click a row to open the source transaction. View all opens the transaction list with the same filters.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Always show source type and status so users know whether a transaction is posted, pending, imported, or reconciled.

13. Bank Balances

Module: Banking

Implementation note: If bank sync is stale, mark the card with a last updated timestamp instead of displaying the balance as fully current.

14. Open Support Tickets

Module: Support

**Open Support Tickets**

Overview of all unresolved support tickets

[View all tickets](#) →

**18**

Total Open

TICKET ID	SUBJECT	PRIORITY	REQUESTER	STATUS	UPDATED
#TKT-1024	Unable to generate payroll report	High	John Doe	In Progress	May 24, 2025
#TKT-1023	Error while importing bank transactions	Medium	Sarah Smith	Pending Response	May 23, 2025
#TKT-1022	Invoice not sent to customer	Medium	Michael Brown	In Progress	May 22, 2025
#TKT-1021	Login issue with mobile app	High	Emily Johnson	Overdue	May 20, 2025
#TKT-1020	Report data mismatch	Low	David Wilson	Pending Response	May 19, 2025

Need help? Create a new support ticket

[+ New Ticket](#)

Open Support Tickets UI reference

User story: As an admin user, I want open support tickets in the dashboard so critical issues are not missed during daily work.

What the user understands: Open ticket count, pending tickets, priority level, due/aging status, and latest unresolved issues.

Data representation logic: Ticket count comes from support records with status not closed/resolved. Priority uses ticket priority, SLA due time, and business impact. Aging is current time minus created time or last response time.

Expected interaction: Click a ticket to open support detail; Create Ticket opens a quick drawer; View all tickets opens support center.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Support visibility should respect account role and internal/external ticket permissions.

Prepared for Balanzify product, design, and engineering teams

 Activity Feed Real-time updates from across the platform View all activity →		
	John Doe was added as a new employee Added by Sarah Smith	2 min ago HR Management
	Invoice INV-2025-0456 was paid Paid by Acme Corp	15 min ago \$5,250.00
	Leave request from Emily Johnson requires approval Leave type: Annual Leave (3 days)	1 hr ago Pending Approval

	Payroll for May 2025 is now processed Total Employees: 32	5 hrs ago Payroll
	System backup completed successfully Backup size: 245 MB	6 hrs ago System
Show more ▾		

User story: As an owner or admin, I want a recent activity feed so I can understand what changed across the business.

Data representation logic: Activity feed aggregates normalized events from audit logs and business modules. Each event should include actor, entity, action, amount/status when applicable, timestamp, and source module.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Prepared for Balanzify product, design, and engineering teams

16. Top Customers

Module: Customers and Sales Analytics

Implementation note: Allow the user to switch between paid revenue, invoiced amount, outstanding balance, and profit contribution when available.

17. Top Selling Products

Module: Inventory and Sales

Top Selling Products

Based on total quantity sold

This Month

⌵

⋮

PRODUCT		QUANTITY SOLD	REVENUE	% OF TOTAL
1	 iPhone 15 Pro Max SKU: IP15PROMAX	128 ↑ 22.4%	\$153,600.00 ↑ 18.7%	28.6%
2	 MacBook Air M2 SKU: MBA-M2	96 ↑ 16.2%	\$115,200.00 ↑ 14.3%	21.4%
3	 AirPods Pro (2nd Gen) SKU: APP2	186 ↑ 30.1%	\$55,800.00 ↑ 25.6%	13.1%
4	 Apple Watch Series 9 SKU: AW-S9	74 ↑ 11.8%	\$29,600.00 ↑ 9.2%	8.7%
5	 iPad Air (5th Gen) SKU: IPAD-AIRS	62 ↓ 8.5%	\$24,800.00 ↓ 4.3%	4.6%

View all products →

User story: As a sales or inventory user, I want top-selling products so I can plan reorder, pricing, and promotions.

What the user understands: Which products move fastest, the quantity sold, revenue generated, and sales contribution percentage.

Data representation logic: Aggregate sales line items by product for posted invoices and sales receipts. Quantity equals sold quantity minus refunded quantity. Revenue equals net line amount after discount before or after tax based on report setting.

Expected interaction: Click a product to open product detail, stock movement, or sales report. View products opens inventory list filtered by sales rank.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Top Selling Products UI reference

Implementation note: For bundles, show both bundle-level sales and component stock impact if inventory tracking is enabled.

[View cash flow →](#)

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Prepared for Balanzify product, design, and engineering teams

20. Payroll Snapshot

Module: Payroll

Implementation note: Payroll cards must be permission protected because they expose compensation and employee data.

21. Tax Center Snapshot

Module: Taxes and Agencies

User story: As a finance or payroll tax user, I want tax due and filing status summarized so I can avoid missing deadlines.

What the user understands: Total tax payable, overdue tax, paid tax, next filing date, next payment due, and tax breakdown by type.

Data representation logic: Tax payable equals accrued tax liabilities minus recorded tax payments for selected tax agencies and periods. Overdue tax has due date before today and unpaid amount greater than zero. Paid tax uses recorded payment status.

Expected interaction: Go to Tax Center opens payment and filing list. Users can filter by agency, tax type, status, and due date.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Show due dates prominently and use countdown labels because tax value alone does not reveal urgency.

Module: Receivables

Accounts Receivable Aging UI reference

User story: As a collections user, I want aging buckets so I can prioritize follow-up based on customer payment risk.

What the user understands: Current, 31-60, 61-90, and 90+ day receivables, plus highest-risk customers and totals.

Data representation logic: Calculate open invoice balance by due date aging bucket as of report date. Current means not due or within 0-30 days depending on reporting policy. Exclude voided invoices and apply payments/credits before bucketing.

Expected interaction: Click a bucket or customer to open A/R aging detail filtered by customer and bucket.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: Always age by due date for collections. Provide invoice-date aging only as a report option.

23. Accounts Payable Aging

Module: Payables

Implementation note: Payment planning should consider cash runway and due-date priority, not only total payable amount.

Expense Breakdown UI reference

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Prepared for Balanzify product, design, and engineering teams

25. Cash Runway

Module: Cash Forecasting

User story: As an owner, I want to know how long current cash can support operations so I can act before cash pressure becomes urgent.

What the user understands: Estimated months of runway, cash balance, monthly burn, net monthly cash flow, and the estimated date when cash may run out.

Data representation logic: Runway months = current available cash divided by average monthly net cash burn. Burn should use a rolling 3 or 6 month average of recurring operating outflows minus recurring inflows. If net cash flow is positive, label runway as stable or expanding instead of finite.

Expected interaction: View cash flow opens forecast details. Users can adjust forecast assumptions such as expected collections, payroll, tax payments, and upcoming bills.

Data quality state: Show loading, empty, error, permission-restricted, and stale-data states so users know whether the card is reliable.

Implementation note: This card is a forecast indicator, not a guarantee. Always show the assumptions and last updated date.

Quick Actions

Perform key tasks quickly

[View all actions →](#)

 Create Invoice Generate and send new invoices	 Record Expense Add and categorize business expenses	 Add Customer Create a new customer profile	 Add Product Add new product or service to inventory
 Reconcile Bank Match transactions and reconcile accounts	 Run Payroll Process payroll and generate payslips	 Create Report Generate financial reports and insights	 Create Leave Apply for leave or manage requests

Data quality state: If a feature is not enabled, show an upgrade/setup prompt rather than a broken action.

Prepared for Balanzify product, design, and engineering teams

9. Engineering Acceptance Criteria

These conditions should be met before dashboard development is considered complete.

Area	Definition of done
Data accuracy	Card totals must match the detailed report when the same filters are applied. Any difference must be explained by basis, currency, or status settings.
Performance	Primary dashboard should load critical cards quickly. Heavy charts can lazy-load after KPI strip and AI alerts.
Permissions	Sensitive cards should be hidden, masked, or restricted based on user role and feature plan.
Drill-down reliability	Every card click must open the correct module/report with filters applied and no lost context.
Accessibility	Cards need text labels, keyboard focus, meaningful alt text, readable contrast, and non-color-only status indicators.
Responsive behavior	Desktop can use multi-column layout. Tablet should stack major zones. Mobile should prioritize KPI, AI insights, quick actions, and only critical cards.
Audit and traceability	Actions that change records must create audit logs. Dashboard read events do not need audit logs unless viewing sensitive payroll/tax data is tracked by policy.
Testing	Test with empty company, demo company, high-volume company, multiple currencies, multiple branches, and restricted user roles.

10. Appendix: Key Metric Formula Reference

This formula library helps engineering and QA validate dashboard output.

Metric	Formula / data rule
Total Revenue	Sum of posted sales income transactions for selected period, less refunds/credit memos according to reporting basis.
Cash Balance	Sum of active bank and cash account ledger balances as of report date.
Accounts Receivable	Sum of open customer invoice balances and debit memos minus credits and payments.
Accounts Payable	Sum of open supplier bill balances minus supplier credits and payments.
Payroll Due	Next scheduled payroll run estimated or finalized payroll amount for the selected pay schedule.
Tax Due	Open tax liabilities due by selected tax period or next due window.
Inventory Value	Quantity on hand x inventory cost method value, such as FIFO or weighted average.
Net Profit	Income - COGS - operating expenses + other income - other expenses.
Attendance Rate	Present scheduled employees / total scheduled employees x 100.
Cash Runway	Current cash balance / average monthly cash burn.
